

Sample Lab Report

AIM OF THE STUDY:

The objective of this test is to determine the California bearing ratio by conducting a load penetration test in the laboratory.

Aim of study may include a very brief introduction and purpose of test.

RELEVANT STANDARDS:

1. IS: 9669 - 1980 Indian Standard Specifications for CBR molds and its accessories.
2. IS: 2720 (Part 16) -1980: Indian Standard Specifications for laboratory determination of CBR

This should list all the relevant standard required to conduct the test.

RELEVANCE AND IMPORTANCE

The California bearing ratio test is a penetration test, used for the evaluation of sub-grade strength of roads and pavements. This value is broadly used and applied in design of the base and the sub-base material for pavement. The Indian Roads Congress (IRC) has standardised the guidelines for the design of flexible pavements based on CBR test (IRC: 37-2001). The CBR

Should include a brief summary test and its relevance and importance.

OBSERVATION AND CALCULATION

.....

Should include all the observation recorded during the experiment and calculation.

PRESENTATION OF RESULT

The CBR value found.....

In this section the results of the test should be presented in compliance with the relevant standard.

INTERPRETATION OF RESULT

The CBR value of X% indicates that the soil has very good strength and the pavement layers can be.....

Should include the result interpretation.

MARKS DISTRIBUTION FOR LAB REPORT

Element	Distributed Marks
Aim of Experiment	–
Relevant Standards	1
Relevance and Importance	1
Observation and Calculation	1
Result	1
Interpretation of Result	1
Total Marks	5

Evaluation for each elements will be done by awarding either 0 or 1. NO FRACTION MARKING.
